ABSTRACT

This 1997 KIDS COUNT data book provides a national and state-by-state (including the District of Columbia) compilation of benchmarks of the educational, social, economic, and physical well-being of children in the United States. Ten indicators of children's well-being are taken from government sources: (1) percent of low birth-weight babies; (2) infant mortality rate; (3) child death rate; (4) rate of teen deaths by accident, homicide, and suicide; (5) teen birth rate; (6) juvenile violent crime arrest rate; (7) percent of teens who are high school dropouts; (8) percent of teens not attending school and not working; (9) percent of children in poverty; and (10) percent of families with children headed by a single parent. An overview discusses improving education for children in poor neighborhoods. A summary and findings section presents overall trends for each indicator. The bulk of the book consists of graphic and numerical presentations of the indicators nationwide and by state. For each state, information is presented on demographic changes, health and economic characteristics, and education indicators. Appendices delineate standard scores and national rankings, states in rank order by indicator, multi-year trend data for Kids Count Indicators, multi-year national composite ranks, and states in rank order by education indicator. The document ends with definitions of the Kids Count Indicators, the rationale for their selection, and primary contacts for State Kids Count Projects. (SD)

KIDS COUNT is a product of the Annie E. Casey Foundation, a non-profit, non-partisan, non-sectarian, non-racial, and state-by-state effort to work with the states to address the needs of children in the United States. The preceding policy remarks and statistics with their footnotes are a bold effort to bring KIDS COUNT's research to a broader audience and to provide a more complete picture of the current state of child well-being in the United States. The Foundation also funds a nationwide network of state-level KIDS COUNT projects that provide a more detailed perspective by a community picture of the condition of children.

This *KIDS COUNT Data Book* could not be produced and distributed without the help of numerous people. The publication was assembled and produced under the general direction of Dr. William P. O'Hare, KIDS COUNT Coordinator at the Annie E. Casey Foundation.

Most of the data presented in the *Data Book* were collected and organized by the Population Reference Bureau under the direction of Dr. Carol De Vita. We owe a special debt of gratitude to Kelvin Pollard of the Population Reference Bureau who worked tirelessly assembling, organizing, checking, and rechecking the figures seen here.

A special thanks goes to Robert McIntire and his staff in the Office of Employment and Unemployment Statistics in the Bureau of Labor Statistics for providing tabulations of the Current Population Survey microdata files from 1984 through 1995.

We also want to thank Dr. Harry Rosenberg and M. Cindy Dambreville of the Division of Vital Statistics within the National Center for Health Statistics for providing special tabulations of 1994 mortality data.

Thanks to Stephanie Ventura of the Division of Vital Statistics within the National Center for Health Statistics for providing special tabulations of 1994 fertility data.

We would also like to thank Dr. Kathleen S. Short from the Poverty and Health Statistics Branch of the U.S. Census Bureau for providing special tabulations of the March 1996 Current Population Survey on the number of children in high-poverty areas.

We also owe a special thanks to Martye T. Scobee of the Urban Studies Institute at the University of Louisville for providing data on the share of children living with parents who did not finish high school. And to Dr. Paul Voss and Roger Hammer at the Applied Population Laboratory at the University of Wisconsin-Madison for providing data on the share of children not in nursery school or kindergarten.

Special thanks are also due Sam Shelton, Jeffrey Fabian, and Scott Rier of KINETIK Communication Graphics, Inc., who were responsible for the design of the book, and Podesta Associates for providing assistance in the promotion and dissemination of the *Data Book*.

Finally, we would like to thank the state KIDS COUNT projects listed on page 170 for helping to get the *Data Book* into the hands of national, state, and local leaders across the country.

Permission to copy, disseminate, or otherwise use information from this *Data Book* is granted as long as appropriate acknowledgment is given.

To obtain additional copies of this publication, call 410.223.2890 or write to the Annie E. Casey Foundation, Attn: *KIDS COUNT Data Book*, 701 St. Paul Street, Baltimore, MD 21202.

Overview

The 7.1 million children growing up in poor communities today face tough odds.¹ Research predicts that they are at greater risk of being sick and having inadequate health care; of being parents before they complete school; of being users of easily available drugs; of being exposed to violence; and of being incarcerated before they are old enough to vote. Although poor neighborhoods include individuals and families with extraordinary resilience and strength, too many kids growing up in such environments will reach adulthood unprepared to parent, to work, and to contribute to society.

Improving the odds for children in low-income communities will require many things, including greater access to supports that all families need to raise kids successfully—employment opportunities for parents, quality health care, formal and informal networks of adults who can assist in times of crisis, vibrant religious institutions, organized recreation, and safe streets. But of all the community institutions that help children become capable adults, perhaps none is more important than school. For generations, education has been the vehicle for advancing the social and economic status of children and families, compensating for poverty and distressed environments, and, for millions of kids, paving the way to opportunities unavailable to their parents. Traditionally, good

schools in America's neighborhoods fueled family dreams and fortified children's futures.

Today, the importance of education is greater than ever. Because of changes in our economy and the demands of the workplace, literacy, computational, computer-literacy, and problem-solving skills are even more powerful predictors of a child's future success. Research shows that school completion and academic success increase children's ability to escape poverty, form strong families, and raise successful kids of their own. The poverty rate for high school dropouts is 10 times that of college graduates (see Figure 1). Moreover, college graduates earn twice the annual income of adults with only a high school diploma and three times the income of high school dropouts.² In other words, a good education is one of the strongest ways to break the cycle of intergenerational poverty (see Figure 2).

Tragically, the potential of education to offset the disadvantages of growing up in a poor neighborhood is not being realized. In fact, the likelihood of getting a decent education is decreasing in the very communities where it is needed most. If our nation is to remain prosperous and committed to equality of opportunity, we must create successful schools for poor children. This fundamental challenge is the theme of our eighth annual *KIDS COUNT Data Book*.

Schools in Poor Communities

Overall, our nation's schools have made steady improvement over the last decade. For example, high school students are completing more rigorous curricula, and dropout rates have

While reasonable people might debate the most powerful mix of strategies and approaches for improving the life chances of disadvantaged children, everyone agrees that a high-quality education is at least part of the solution.

decreased.¹ These improvements, however, are not evident in schools serving our poorest communities. In 1994, for example, the dropout rate for kids in low-income families was five times as high as that for kids in more affluent families.² Moreover, schools with high proportions of poor kids score lower on standardized achievement tests, and students attending schools in poor neighborhoods learn less. According to the Center on National Education Policy, 13-year-old students in poor school districts have the math skills of 9-year-olds in more affluent schools.³

Few would dispute that such dismal results are connected, at least in part, to the challenges poor children bring to school each day. Children in low-income families, for example, have fewer role models to inspire academic success, and compared with other kids, they are raised in homes with fewer books and are read to less. The poor nutrition associated with poverty also affects school performance and leads to more frequent illness and school absence. In addition, many poor children live daily with the distractions of drugs and violence that afflict our most distressed communities.

The challenge of providing poor children with the education they need and deserve starts with money. According to a recent report by the U.S. General Accounting Office, more affluent districts spend about 24 percent more per student than poor districts.⁴ One consequence of this funding disparity is that schools in poor neighborhoods are more likely to have inadequate heating, plumbing, lighting, safety, and space. Students attending

such schools are also apt to have fewer and older textbooks; insufficient instructional supplies; and less access to calculators, computers, and advanced technology.

But the educational disadvantage of poor children goes beyond basic bricks, mortar, and books. Schools in high-poverty neighborhoods tend to have the least experienced and least prepared teachers. On average, such schools have more teachers with three or less years experience and, in core subjects, have more teachers who did not specialize in the subjects they teach.⁵

Perhaps the most disturbing expression of educational inequity is the low expectations we have for schools in poor neighborhoods and for the students who attend them. Typically, such schools have lower standards, as measured by the lack of challenging courses, extensive use of tracking, and inflated grading practices. According to a U.S. Department of Education report, students receiving grades of "A" in high-poverty schools achieve at about the same level as "C" and "D" students elsewhere.⁶

What Kids in Poor Communities Need

Providing poor children with the same learning opportunities that more advantaged students receive is possible, but it will require a level of imagination, commitment, and collaboration that most education-reform efforts have thus far failed to produce. The truth is, there is no easy fix to the problem of bad schools in poor neighborhoods—no one-time infusion of money, no donation of computers, and no quick influx of reading volunteers will suffice. At a minimum, turning around schools in poor

Overview

communities will require a comprehensive, decade-long commitment, driven by data and informed by research and best practice.

Specifically, we can point to five ideas that have demonstrated that they can positively contribute to kids' success in school and overall development:

- preschool experiences that prepare children to learn;
- schools that are small enough to engage every child;
- high standards in curriculum, instruction, and assessment;
- strong, meaningful family participation;
- making education part of a larger community commitment to healthy youth and family development.

Preschool experiences that prepare children to learn.

High-quality early childhood care and preschool education can stimulate cognitive development, increase school readiness, and advance academic achievement in the early elementary grades.⁹ In 1993, however, 40 percent of 3- to 5-year-olds were not in nursery school or kindergarten. A growing number of states—for example, Minnesota, North Carolina, Ohio, Oregon, and Vermont—are promoting and expanding the development of high-quality Head Start, zero-to-three, and other programs aimed at improving the chances that disadvantaged kids will begin their formal education ready to learn. In many cities, Reach Out and Read programs are integrating literacy development into well-child visits with health-care providers. Across the country, these critical preschool resources should be targeted to districts where the need is greatest.

Schools that are small enough to engage every child.

Small schools—whether freestanding or schools-within-schools—nurture positive

teacher-student relationships; provide more instructional flexibility to respond to kids' specific learning styles; and provide a safer, more secure educational climate.¹⁰ Several cities have developed models of small, supportive learning environments that improve attendance and achievement. In New York City, for example, small secondary schools created by teachers and community organizations, called New Visions Schools, are demonstrating the difference that engaging teaching can make in expanding horizons for our most at-risk kids. Since 1992, the 21 New Visions Schools have shown higher attendance rates and lower dropout rates than other public schools in the city. Moreover, students in New Visions Schools are performing at above-average levels of academic achievement.

High standards in curriculum, instruction, and assessment.

Effective schools have high learning standards, challenging curricula based on those standards, and instructional practices that keep kids actively engaged in learning. Such schools also develop assessments, tied to their standards and curricula, that are used to help kids and parents understand academic progress and to help teachers adjust instructional practices. High standards show children that schools care, that learning is valuable, and, most importantly, that they have the ability to succeed. States like Kentucky, Washington, and Maryland and districts like Milwaukee and Philadelphia have taken significant steps to set standards that are aligned with curriculum, instruction, and assessment practices. In Kentucky, for example, there have been significant achievement gains in reading, writing,

Education Reform Working in Kentucky

The Kentucky Education Reform Act (KERA), enacted in 1990, was a sweeping education reform package that put in place provisions for stronger preschool programs, ungraded primary programs, higher standards for academic performance, new curricula, school-based accountability, a new comprehensive assessment program, and family resource centers that link poor kids and families to social services. Beneficiaries of this effort include Kentucky 4th graders, whose progress toward the state's long-term goals for 2012 are shown below.

Progress Among 4th Graders in Kentucky 1992-93 to 1995-96

SOURCE: Kentucky Department of Education

The likelihood of getting a decent education is decreasing in the very communities where it is needed most.

math, science, and social studies among 4th graders—the grade cohort that started school at the beginning of the statewide reform effort. At the local level, in Philadelphia, the Central East Middle School's Talent Development Model combines higher level courses and enriched learning experiences for all students, regardless of previous school performance, with "extra doses" of support when students show signs of falling behind their peers. This effort has resulted in significant academic gains for all students.¹¹

Strong, meaningful family participation. Active and informed family participation has long been recognized as a key element of successfully educating children. For some families, involvement means communicating frequently with teachers, knowing what goes on in their child's school, and helping kids with their homework. For others, it means participating on school councils that make decisions about school policy. While the level of involvement will differ from family to family, good schools welcome them as genuine partners and contributors to their children's education.¹² In poor communities, where many adults' negative school experiences have left them uncomfortable, distrustful, and hesitant to become involved, family participation is a significant challenge. It is, however, one that can be successfully addressed. For example, the Texas Interfaith Education Foundation's Alliance School Project provides opportunities for families and teachers to learn about effective school-reform practices and to work together in addressing the needs of both kids and fami-

lies. In 1993-1994, 44 of the then 55 Alliance Schools increased the numbers of students passing all sections of Texas' standardized academic skills test. And, in 1994-1995, test scores improved in 58 of the 70 Alliance Schools. Similarly, Dr. James Comer's School Development Program, operating in schools across the country, has engaged families in school-management decisions and other meaningful activities.

Making education part of a larger community commitment to healthy youth and family development. Although critically important, good schools are only one variable in the equation that determines a child's life chances. To thrive, children—especially at-risk kids—need religious institutions, family-support centers, recreational activities, cultural enrichment, libraries, and a host of other resources that contribute to their civic, social, emotional, and educational development.¹³ Even the strongest schools need to partner with organizations that will supplement their efforts and jointly accept responsibility for improving youth outcomes. Among the hundreds of school-community partnerships operating in low-income neighborhoods across the country is the New York City Beacons program. These school-based community centers, which are open in the evenings and on weekends and provide a wide range of activities and services in one setting, have demonstrated that schools, working with communities, can effectively broaden learning and extend supports to families as well as children. The Red Hook Beacon in Brooklyn, for example, offers an after-school

Overview

center for elementary school students; a computer education center for kids and adults; a newspaper written and published by neighborhood teens; weekly family nights; athletic leagues; and several different counseling and health services. Another successful partnership is the Los Angeles-based Vaughn Family Center, a collaboration of schools, local agencies, and parents that offers counseling, tutoring, housing assistance, and immunizations and that helps parents develop the skills they need to become effective advocates for their children and themselves.¹⁴

No single idea mentioned above is, in and of itself, a "magic bullet" that will ensure the effectiveness of schools in poor communities. But taken together, and viewed as parts of a whole, we believe that these proven ideas are powerful enough to improve the quality and increase the impact of education on the lives and futures of kids who are most at risk.

What Policymakers Need to Do

Across the country there are schools in distressed communities that have shown that all kids can achieve at high levels. These schools, like the kids they serve, must overcome significant odds. Unfortunately, such schools tend to be the exception rather than the rule.

As promising and vital as these exemplary schools are, the sad and simple fact is that there are too few of them to stem the tide of failure that overwhelms some of our poorest school districts. Put simply, while these successful schools may reach tens of thousands of poor kids, our nation needs an agenda that will address the needs of the millions of poor chil-

dren living in distressed communities. Such an approach requires new policies and incentives that will restructure, reform, and revitalize the operation of large school systems and that will enhance the ability of individual schools to innovate. Policymakers need to create the broad systemic conditions that will encourage the development of schools where effective teaching and learning is the norm. At a minimum, policymakers ought to:

- decentralize authority and resources to local schools;
- support and reward the development of principals and teachers;
- create systems for school-based accountability.

Decentralize authority and resources to local schools.

While decentralization of authority and resources is hardly a new idea, it is rarely done with enough depth to have a significant impact on school practice. Meaningful decentralization moves operating funds to the school level and gives spending discretion to schools. Moreover, such decentralization allows genuinely representative school-based governance structures—for example, local school councils of principals, teachers, parents, and community representatives—to make critical decisions about key personnel, curricula, schedules, instructional programs, materials, and facilities.

Support and reward the development of principals and teachers.

In addition to autonomy and resources, serious reform requires professional development that can enhance the learning environment within schools. Such development activities provide educators with regular opportuni-

The challenge for poor communities and the nation is creating the conditions that allow successful schools to be the rule rather than the exception.

ties to access knowledge and develop new skills—by working with each other and with outside sources that they believe are most credible.¹⁸ Without more serious attention to the ways in which school districts support professional development—particularly for principals—even the most thoughtful school-reform efforts will be incomplete and uneven.

Create systems for school-based accountability. In return for additional school-based authority, resources, and support, teachers and their unions must work with school district leaders to create meaningful accountability strategies that offer fair rewards and sanctions to individual schools and that provide incentives for systemwide improvement. Given the experiences of some states and districts—for example, Kentucky, Maryland, and Philadelphia—we acknowledge the difficulty in creating such a process. Yet concrete action around school accountability may be the most obvious and critical indication that public and political leaders are, in fact, serious about improving the educational quality of our most distressed schools.

Sustained Commitment and Resolve

The recommendations presented here represent a belief that our nation can and must fix our most troubled schools. Although this agenda is difficult and complex, enough is known to move forward with some confidence. What is needed now is commitment and resolve, which can only be demonstrated by taking bold action and forging new relationships among educational stakeholders. Specifically:

- School-system leaders must demonstrate that they value their relationship with local communities. They can do so by engaging and listening to community constituents and creating reform plans that respect and respond to their needs and perceptions. Equally important is providing teachers, and others who work with kids, with compensation and working environments that reflect the importance of their challenging work.
- Unions, parents, school boards, community organizations, and politicians must demonstrate that they can put aside traditional differences, can make student needs—rather than adult needs—the priority, and can work collaboratively on behalf of kids. Doing so will require these groups to move beyond traditional antagonism and finger pointing, to focus on the common objective of improving educational outcomes, and to accept collective responsibility for results.
- States must demonstrate that they will fulfill their responsibility to ensure an equitable and adequate education for all students. They can do so by providing disadvantaged districts with an equitable level of fiscal support that is sufficient to meet the varied needs of our poorest kids; by giving districts the autonomy needed to pursue creative reforms; and by holding districts publicly accountable for student success.

As any observer of education reform knows, the systemwide commitments outlined above are hard to secure. Politics, professional turf, and competing interests have too often delayed real change. Unfortunately, kids consigned to inadequate schools cannot afford further delay.

In those places where key stakeholders are unable to find the resolve and resources to make meaningful change, we ought to consider more direct ways of ensuring that poor kids have a chance at adequate schooling. If necessary, such explorations should include a variety of nontra-

Overview

ditional options and approaches such as networks of schools organized around instructional methods or educational themes; new alternative schools created through innovative public/private partnerships; multisite learning environments connected through technology; equal-access charter schools with innovative governance structures and creative curricula; and, finally, the assumption of responsibility for local schools by states where that is the only way to secure equitable educational opportunities for all kids. In addition, we believe such explorations should include consideration of school-choice programs that genuinely empower parents and that realistically expand educational options for the poorest families and kids. We believe, for example, there is merit to the idea—recently advanced by observers from both sides of the political spectrum—of providing means-tested scholarships that target our poorest families.¹⁶ These scholarships would provide all eligible families with the amount of money a district would spend annually on a given student.

In addition to adequate financial support, strong versions of school-choice strategies have to provide access to a diverse array of high-quality learning environments—including private schools and public schools in neighboring school districts—and hold those schools accountable for positive results. Finally, we believe that any choice plan worthy of serious consideration should be limited to those schools that are truly willing to provide alternative learning opportunities to *all* kids who seek them.

In sum, all strategies that might accelerate system improvements for poor students should

be considered and evaluated on their merits, rather than their politics, and tested against criteria that assess their ability to offer kids and their families quality options, real opportunities, and improved outcomes. These strategies, moreover, should be embraced, not as an evasion of the public obligation to provide free and adequate schooling, but as a last resort to fulfilling that obligation.

Conclusion

Currently, there are more than 7 million kids living in poor neighborhoods who face a grim future clouded by predictably lousy outcomes. While reasonable people might debate the most powerful mix of strategies and approaches for improving the life chances of disadvantaged children, everyone agrees that a high-quality education is at least part of the solution.

As a nation, we may not yet know how to do everything that is necessary to transform our poorest communities into family-supporting environments. We may not yet know enough about creating adequate jobs, ensuring public safety, or keeping drugs off our street corners and out of our kids' lives. We do, however, know how to create stronger schools that help children learn. The challenge for poor communities and the nation is creating the conditions that allow such schools to be the rule rather than the exception. For this, we need more than just knowledge—we need greater public will and more tenacious resolve. And we need it now.

Douglas W. Nelson
President

The Annie E. Casey Foundation

The broad array of data we present each year in the *KIDS COUNT Data Book* is intended to illuminate the conditions facing America's children and to assess trends in their well-being. By updating the assessment every year, *KIDS COUNT* provides ongoing benchmarks with which to evaluate efforts to improve the lives of children. States can see how they have advanced or regressed since 1985, and they can compare the status of their children to those in other states across several dimensions of well-being. Furthermore, yearly presentation of *KIDS COUNT* data allows us to make incremental improvements year to year as new data become available and methodology is refined.

While 10 measures can hardly capture the full range of conditions shaping kids' lives, we believe the data provided here possess three important attributes: (1) They reflect a wide range of factors affecting the well-being of children (such as health, adequacy of income, educational attainment, and the likelihood of being arrested for a violent crime). (2) They reflect experiences across a range of developmental stages—from birth through early adulthood. (3) They are consistent across states and over time, which permits legitimate comparisons. (For more information about the criteria used to select *KIDS COUNT* indicators see, page 169.)

The data on the following pages present a rich but complex picture of American children. Some dimensions of well-being improved, some worsened, and some showed little change. At the national level, five of the indicators of child well-being showed conditions worsened between 1985 and 1994, four showed improvement, and one indicator showed no change. Naturally, the picture varies from state to state, and state-level measures often mask important differences within a state.¹⁷

KIDS COUNT State Indicators

In the pages that follow, the most recent figures are compared to corresponding data from 1985 to assess the trends during the late 1980s and early 1990s. In order to provide a framework for understanding the indicators of child well-being, several background measures are provided for each state, including five which reflect various dimensions of education.

The 10 key indicators of child well-being used here are all taken from government sources and reflect the best data available for each indicator. However, it is important to recognize that no data are perfect. Many of the indicators used here are derived from samples and, like all sample data, contain a certain amount of random error. Therefore, we urge readers to focus on those differences across states and those changes over time within states that are relatively large. Small differences or changes may be due to random fluctuations.¹⁸ Differences or trends in the well-being of children can best be assessed by using these indicators collectively.

Summary and Findings

Each of the 10 indicators is discussed separately below.

Percent Low Birth-Weight Babies

While most American children get off to a healthy start, babies weighing less than 2,500 grams (about 5.5 pounds) at birth have a high probability of experiencing developmental problems. Therefore, the Percent Low Birth-Weight Babies reflects a group of children who are likely to have problems as they move through the growth stages.

Nationally, 287,607 babies were born weighing less than 2,500 grams in 1994, making up 7.3 percent of all births, compared to only 6.8 percent in 1985. This represents an increase of 7 percent over the 1985-94 period.

The increase in the share of low birth-weight babies raises a number of troubling issues. First, an increase in low birth-weight babies probably reflects the declining health status of many mothers. Second, research shows that women who do not receive adequate early prenatal care are more likely to give birth to a low birth-weight baby. Using a combination of measures to define adequate prenatal care, only 68 percent of mothers giving birth in 1990 had received adequate prenatal care.¹⁸

Mothers who lack health insurance are less likely to seek and obtain prenatal care. According to Census Bureau reports, one-third (33 percent) of all Latinos and more than one-fifth (21 percent) of all African Americans did not have health insurance in 1995. People in poverty, high school dropouts, and young adults (ages 18-24) are also less likely to have health insurance. Furthermore, the National

Institute of Medicine¹⁹ identifies a mother's low level of education as a prominent risk factor for having a low birth-weight baby.

Between 1985 and 1994, no states experienced a decrease in the percent of births that were of low birth-weight. Idaho, Washington, and Vermont showed no change, while Wyoming had the largest increase (up 24 percent). In 1994 the percent of births that were low weight ranged from a low of 5.1 percent in New Hampshire to a high of 14.2 percent in the District of Columbia.

Infant Mortality Rate

Since the first year of life is more precarious than later years of childhood, negative social conditions (such as poverty and an unhealthy environment) have a big impact on this vulnerable group. The number of children (per 1,000 live births) who die before their first birthday is reflected in the Infant Mortality Rate.

Children born to families with fewer advantages are more likely to experience health problems at an early age. For example, one recent study found that the infant mortality rate for children born into poor families (13.5 deaths per 1,000 live births) was more than 50 percent higher than that for children born into families with incomes above the poverty line (8.3 deaths per 1,000 live births).²⁰ The link between poverty and infant mortality helps explain why the infant mortality rate of African Americans remains more than twice that of whites (15.8 compared to 6.6 in 1994). The Infant Mortality Rate of children born to parents with low educational attainment is higher

than that for children born to parents with more education.²¹

Communities where there is a confluence of several problems, such as poverty, unemployment, and illiteracy, tend to have higher infant mortality rates. One reason for the high infant mortality rate in low-income neighborhoods is that residents are less likely to receive neonatal intensive care.²²

While the infant mortality rate in the United States has been falling steadily over the past few decades, there are still 25 countries which have lower infant mortality rates than the United States.²³

Thanks in large part to improvements in medical technology, the U.S. Infant Mortality Rate declined from 10.6 per 1,000 live births in 1985 to 8.0 in 1994. This decline was reflected in every state and the District of Columbia. In 1994 the Infant Mortality Rate ranged from a low of 5.0 in Rhode Island to a high of 18.2 in the District of Columbia.

Child Death Rate

Once children survive the first year of life, mortality drops sharply. In 1994, 15,264 children between the ages of 1 and 14 died in the United States. This amounts to 29 out of every 100,000 children in this age range, down from 34 per 100,000 in 1985.

The Child Death Rate (deaths per 100,000 children ages 1-14) has fallen for the past several years, due in large part to advances in medical care. The general decrease in deaths from motor vehicle accidents, which are a major cause of death among children, also has contributed to a falling Child Death Rate.

Figure 3. Birth Rate of 15- to 17-year-olds: 1985 to 1994

Source: National Center for Health Statistics

The Child Death Rate decreased in 43 states, was unchanged in 1 state, and increased in 6 states and the District of Columbia. In 1994 the Child Death Rate ranged from a low of 17 in Massachusetts to a high of 61 in the District of Columbia.

Rate of Teen Deaths by Accident, Homicide, and Suicide

The Rate of Teen Deaths by Accident, Homicide, and Suicide (this measure was called the Teen Violent Death Rate in previous editions of the *KIDS COUNT Data Book*) reflects deaths from these three causes per 100,000 teens ages 15-19. Deaths from accident, homicide, and suicide accounted for 79 percent of all teen deaths among 15- to 19-year-olds in 1994.

While perceptions of increasing violence in our country highlight the implications of this indicator, it is important to note that accidents continue to account for far more teen deaths than any other source. Between 1985 and 1994, a decline in teen deaths due to accidents (primarily automobile accidents) was offset by a doubling in the number of homicides. The number of teen deaths due to accidents went from 8,202 in 1985 to 6,565 in 1994, while the number of teen homicides went from 1,602 to 3,569 during the same period. The number of teen suicides increased slightly during the period (from 1,849 to 1,948).

Nationally, the Rate of Teen Deaths by Accident, Homicide, and Suicide was 69 per 100,000 teens ages 15-19 in 1994, compared to 63 in 1985. Between 1985 and 1994, this mea-

sure declined in 20 states and increased in 30 states and the District of Columbia. The Rate of Teen Deaths by Accident, Homicide, and Suicide actually rose by more than 50 percent in 2 states and the District of Columbia.

In 1994 the Rate of Teen Deaths by Accident, Homicide, and Suicide ranged from a low of 19 per 100,000 teens ages 15-19 in Rhode Island to a high of 346 in the District of Columbia.

Teen Birth Rate

Teenage childbearing is problematic because it often diminishes the opportunities of both the child and the mother. Births to females under age 18 are particularly troublesome because most of these mothers are unmarried and most have not completed high school. Eight to 12 years after birth, a child born to an unmarried, teenage, high school dropout is 10 times as likely to be living in poverty as a child born to a mother with none of these three characteristics.²⁶ Given the changing nature of our economy, parents with low educational attainment are likely to have a more difficult time in the future finding a stable job that pays a livable wage.

Children born to teenage mothers, most of whom are unmarried, have a relatively low probability of obtaining the emotional and financial resources they need to develop into independent, productive, well-adjusted adults. Research shows that children born to single teenage mothers "are more likely to drop out of school, to give birth out of wedlock, to divorce or separate, and to be dependent on welfare."²⁷ Thus, the births

Summary and Findings

occurring to young teens reflects a growing group of babies who will have to overcome high odds to thrive.

While teenage childbearing is usually denoted by the age of the mother, it is important to recognize that many of the fathers of these babies are not teenagers. Most (51 percent) of the fathers of children born to females under age 18 were in their 20s.²⁷ If teenage childbearing prevention programs focus solely on teenagers, they may be missing an important segment of the people involved in this problem. Furthermore, while data are still scattered and preliminary, there seems to be growing evidence that the births experienced by many young teens may be the result of nonvoluntary sex.²⁸ To the extent teen births are a result of nonvoluntary sex, prevention models which focus on choice may not be appropriate.

We are far from having a complete understanding of why teens have babies, but research has identified four conditions that are associated with teenage childbearing.²⁹ Teens most likely to have a child are those: (1) from economically disadvantaged families and communities; (2) who are not doing well in school and have low aspirations for their own educational achievement; (3) from dysfunctional families; and (4) with substance abuse and behavioral problems.

Nationally, the Teen Birth Rate increased from 31 births per 1,000 females in 1985 to 38 in 1994. However, it is important to note that the rate has inched downward over the past few years (see Figure 3). In 1991 the birth rate among 15- to 17-year-olds was 38.7, but it was 37.8 in both 1992 and 1993, and by 1994 it was

down to 37.6. The birth rate among 18- and 19-year-olds also declined during the 1991-1994 period, and the decline has been experienced by African Americans and whites alike (but not by Latinos). However, it is important to recognize that "out-of-wedlock" births among teens continue to increase even as the overall Teen Birth Rate has fallen.

The national change in teenage childbearing during the 1985 to 1994 period was echoed in nearly every state. Only eight states experienced a decrease in the birth rate of 15- to 17-year-olds between 1985 and 1994. The Teen Birth Rate increased by over 50 percent in Connecticut, the District of Columbia, Nevada, and Rhode Island. In 1994 the Teen Birth Rate ranged from a low of 15 births per 1,000 females ages 15-17 in New Hampshire and North Dakota to a high of 88 in the District of Columbia.

Juvenile Violent Crime Arrest Rate

Being arrested for a violent crime is clearly a negative outcome for a young person, and an increase in this indicator is cause for concern. While violent crime has become a major social policy concern, it is important to note that perceptions do not always reflect the empirical evidence.³⁰

The Juvenile Violent Crime Arrest Rate reflects the rate at which youths between the ages of 10 and 17 are arrested for homicide, forcible rape, robbery, or aggravated assault.

While there has been an increase in the Juvenile Violent Crime Arrest Rate over the nine-year period examined here, it is important to note that there was a decline in the national

Juvenile Violent Crime Arrest Rate between 1994 and 1995. This recent decline has led some experts to change their position on the prospects for a dramatic surge in juvenile crime that was predicted a few years ago.³¹

Interviews with law enforcement officials indicate that educational and preventive services are more likely to be a deterrent to youth crime than is construction of more prisons. In a survey conducted by Northeastern University,³² the vast majority of law enforcement officials agreed that America could sharply reduce crime if government invested more in programs to help children and youth get a good start. They added that if America does not pay for needed investments in programs to help children and youth now, we will all pay far more in crime later.

Nationally, the Juvenile Violent Crime Arrest Rate increased from 305 per 100,000 youths ages 10-17 in 1985 to 517 in 1994. The rate increased in every state except Vermont and Montana, and it more than doubled in 21 states. In 1994 the Juvenile Violent Crime Arrest Rate ranged from a low of 40 in Vermont to a high of 1,650 in the District of Columbia.

Percent of Teens Who Are High School Dropouts

Graduating from high school is critical for obtaining post-secondary education or getting a good job. In many school systems around the country, especially those in wealthy suburbs, a high percentage of students stay in school and graduate on time with a good education.

However, many students, especially those living in troubled inner-city areas, often attend schools where graduating on time with a good

BEST COPY AVAILABLE

education is not the norm. Data from the 1990 Census indicate that 6.2 million kids were living in neighborhoods where more than one-quarter of the 16- to 19-year-olds were high school dropouts.

A recent report³³ from the U.S. Department of Education concludes, "In terms of employment, earnings, and family formation, dropouts from high school face difficulties in making the transition to the adult world." In any given year, the likelihood of slipping into poverty is about three times higher for high school dropouts than for those who have finished high school. Between 1992 and 1993, 5.1 percent of high school dropouts became poor, compared to only 1.8 percent of those with at least a high school diploma.³⁴

Teens who drop out of high school face enormous odds for achieving financial success in life. Data from 1995 indicate that by the time people reach prime working age (25-54), the median personal income of those with just a high school degree (\$17,500) is almost twice that of those who dropped out of high school (\$9,984). The median personal income of those with a college degree (\$34,242) is more than three times that of high school dropouts.

Ongoing changes in the economy have increased the financial costs of dropping out of high school. Between 1973 and 1995, the average hourly wage (adjusted for inflation) of high school dropouts fell by 23 percent.³⁵ The deterioration of wages among poorly educated workers has hit the youngest workers the hardest.

As America moves into the 21st century, when advanced skills and technical knowl-

edge will be required for most good-paying jobs, the prospects for those who have not completed high school will be even more dismal. The economic gap between those with a high school diploma and those who drop out is likely to grow.

Nationwide, 9 percent of teens ages 16-19 were dropouts in 1994, compared to 11 percent in 1985. However, the share of dropouts actually rose in eight states between 1985 and 1994, and it was unchanged in eight other states. In 1994 the high school dropout rate ranged from a low of 3 percent in Connecticut to a high of 13 percent in Arizona, Florida, Louisiana, Texas, and West Virginia.

Percent of Teens Not Attending School and Not Working

Late adolescence is a particularly important time for the transition to adulthood. The Percent of Teens Not Attending School and Not Working reflects a group of young people who are not engaged in either of the core activities that usually occupy people during this crucial period in their lives. Clearly, those who have dropped out of school are extremely vulnerable. But even those who have finished school but are not working belong to a marginalized group. Work experience at this point in their life is critical, and people who spend a large share of their young adult years unemployed have a hard time finding and keeping a job later in life.

Between 1985 and 1994, there was a small decline in the share of 16- to 19-year-olds not attending school and not working. This probably reflects counterbalancing

trends. Since the dropout rate is down, more students are in school rather than idle. Among those who are out of school, however, the share who actually found jobs has probably declined. Between 1985 and 1994, nearly every state showed improvement in this measure. In 1994 the Percent of Teens Not Attending School and Not Working ranged from a low of 4 percent in Connecticut to a high of 17 percent in West Virginia.

Percent of Children in Poverty

The Percent of Children in Poverty is perhaps the most global and widely used indicator of child well-being. This is due, in part, to the fact that poverty is closely linked to a number of undesirable outcomes in areas such as health, education, emotional well being, and delinquency. The data shown here are based on the government's official poverty measure (\$15,569 for a family of four in 1995).

Between 1985 and 1994, there was no change in the poverty rate of children (21 percent), but this masks countervailing trends during this period. National data show that the poverty rate among related children (under age 18) declined from 1985 to 1989, increased from 19.0 percent in 1989 to 22.0 percent in 1993, before inching downward to 21.2 percent in 1994 and 20.2 percent in 1995.

Children born to parents who have not graduated from high school have a strong likelihood of growing up in poverty. In 1995 the poverty rate for children living with parents who dropped out of high school was 57 percent, compared to 4 percent for children

Summary and Findings

who have at least one parent who obtained a college degree (see Figure 2 on page 5).

Despite the enormous wealth in the United States, our child poverty rate is among the highest in the developed world. One study* which examined child poverty rates in 17 developed countries indicates that the child poverty rate in the United States is 50 percent higher than the next highest rate. The gap in the child poverty rate between the United States and other developed countries is a product of differences in private sector income, but the gap is greatly accentuated by enormous differences in the role government plays in alleviating child poverty. This lack of investment in our children will put us at a competitive disadvantage in the international marketplace of the 21st century.

In 1994 there were 10 states and the District of Columbia where a quarter or more of all children were poor. In 1994 the child poverty rate ranged from a low of 9 percent in New Hampshire to a high of 37 percent in the District of Columbia.

Percent of Families With Children Headed by a Single Parent

The Percent of Families With Children Headed by a Single Parent has risen steadily over the past few decades and is a growing point of concern among policymakers and the public. Single-parent families, particularly those formed when unmarried teenagers give birth, are a prominent focus of welfare reform.

The share of families with children headed by a single parent increased from 22 per-

cent in 1985 to 26 percent in 1994. Every state except Utah recorded an increase in this measure between 1985 and 1994. In Minnesota and West Virginia, the share of children living in single-parent families increased by more than 50 percent between 1985 and 1994.

Children growing up in single-parent households typically do not have the same economic or human resources available as those growing up in two-parent families. Only one-third of mother-headed families received child support or alimony in 1994. Moreover, public assistance seldom lifts poor children out of poverty."

In 1994 the Percent of Families With Children Headed by a Single Parent ranged from a low of 14 percent in Utah to a high of 58 percent in the District of Columbia.

National Composite Rank

1997

A state's National Composite Rank is determined by the sum of a state's standing on each of 10 measures of the condition of children arranged in sequential order from highest best (1) to lowest worst (51). The measures include: percent low birth-weight babies; infant mortality rate; child death rate; rate of

teen deaths by accident, homicide, and suicide; teen birth rate; juvenile violent crime arrest rate; percent of teens who are high school dropouts; percent of teens not attending school and not working; percent of children in poverty; and percent of families with children headed by a single parent.

National Indicator Maps: State Rates

Percent low birth-weight babies*

1994

-  More than 20% better than state median (5.8 and lower)
-  Up to 20% better than state median (5.9 to 7.3)
-  Up to 20% worse than state median (7.4 to 8.8)
-  More than 20% worse than state median (8.9 and higher)

KIDS COUNT Standard Scores and National Rankings

This chart assists readers in comparing states' performance based on the 10 KIDS COUNT measures of child well-being. In addition to showing whether a state ranks higher or lower overall than another state, this chart shows the differences among states based on the sum of their standard scores. If a state had the exact state mean on each indicator, then the sum of the standard scores for that state would be zero. States are highly clustered near the middle of the distribution, as evidenced by the large number of states in the shaded area.

This set of tables lists the states in rank order for each of the 10 KIDS COUNT indicators based on the most recent data available. This set of tables allows the reader to easily compare the relative performance of states on each individual measure. The highest best rank is one (1); the lowest worst rank is fifty-one (51). Whenever there is a tie of two or more states, each state is assigned the same higher better rank.

Percent low birth-weight babies
1994

Rank	State	Rate	Rank	State	Rate

The 1997 *KIDS COUNT Data Book* is the eighth annual profile of child well-being produced by the Annie E. Casey Foundation. However, the indicators of child well-being have changed each year, making year-to-year comparisons of state ranks problematic. This chart provides national composite rankings for 1988 through 1997 using a consistent set of indicators—namely, those used to derive the 1997 composite rankings. The national composite rankings for the 1997 *KIDS COUNT Data Book* are based on data from 1994 (the most recent available year); similarly, the national composite rankings for 1988 through 1996 are based on data from three years prior to the year profiled. In other words, the data used to generate the rankings shown here reflect the same years shown in Appendix 3.

This set of tables lists the states in rank order based on the five key education indicators provided for each state in the body of the report. The tables allow the reader to easily compare states on these key measures. Whenever there is a tie of two or more states, each state is assigned the same higher better rank.

Percent of 3- to 5-year-olds who were not enrolled in nursery school or kindergarten in 1993

Child Death Rate (deaths per 100,000 children ages 1-14) is the number of deaths (from all causes) of children between ages 1 and 14 per 100,000 children in this age range. The data are reported by place of residence, not place of death.

SOURCES: **Death Statistics:** National Center for Health Statistics (NCHS). **1989 through 1994 data:** Special Tabulations by NCHS, Division of Vital Statistics, "Deaths From 282 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State," for each year from 1989 through 1994. **1985 through 1988 data:** *Vital Statistics of the United States*, Vol. II, Mortality, Part B, Table 8-3.

Population Statistics: U.S. Bureau of the Census, Population Division.

Infant Mortality Rate (deaths per 1,000 live births) is the number of deaths occurring to infants under 1 year of age per 1,000 live births. The data are reported by place of residence, not place of death.

SOURCES: National Center for Health Statistics. **1994 data:** "Advance Report of Final Mortality Statistics, 1994," *Monthly Vital Statistics Report*, Vol. 45, No. 3, Supplement (September 30, 1996), Table 29. **1993 data:** "Advance Report of Final Mortality Statistics, 1993," *Monthly Vital Statistics Report*, Vol. 44, No. 7, Supplement (February 29, 1996), Table 25. **1992 data:** "Advance Report of Final Mortality Statistics, 1992," *Monthly Vital Statistics Report*, Vol. 43, No. 6, Supplement (December 8, 1994), Table 27. **1991 data:** "Advance Report of Final Mortality Statistics, 1991," *Monthly Vital Statistics Report*, Vol. 42, No. 2, Supplement (August 31, 1993), Table 24. **1990 data:** "Advance Report of Final Mortality Statistics, 1990," *Monthly Vital Statistics Report*, Vol. 41, No. 7, Supplement (January 7, 1993), Table 25. **1989 data:** "Advance Report of Final Mortality Statistics, 1989," *Monthly Vital Statistics Report*, Vol. 40, No. 8, Supplement 2 (January 7, 1992), Table 25.

1985 through 1988 data: *Vital Statistics of the United States*, Vol. II, Mortality, Part B, Table 8-2.

Juvenile Violent Crime Arrest Rate (arrests per 100,000 youths ages 10-17) is the number of arrests of youths under age 18 for violent offenses (homicide, forcible rape, robbery, or aggravated assault), per 100,000 youths between ages 10 and 17. The annual arrest figures include all arrests of youths for violent offenses during the year, including repeated arrests of the same individual for different offenses. Because some local law enforcement agencies do not submit their data to the FBI every year, the number of juveniles arrested for a violent crime in each state was adjusted to compensate for the proportion of the state population not covered by local law enforcement agencies submitting reports to the FBI. In 1995, crime figures were reported for jurisdictions representing 75 percent of the U.S. population.

The data shown here represent three-year averages. For example, the figure for 1994 is the average of data from 1993 through 1995. Due to changes in data collection procedures, 1993 and 1995 data were unavailable for Illinois, 1994 and 1995 data were unavailable for Montana, and 1995 data were unavailable for Kansas and New Hampshire. As a result, the figure for Illinois is solely 1994 data, the 1994 figure for Montana actually represents 1993 data, and the 1994 figures for Kansas and New Hampshire are two-year averages of 1993 and 1994 data.

While policies and practices regarding arrests of persons under 18 may vary from state to state, it is widely believed that the policies and practices are more consistent for violent crimes than for less serious ones.

SOURCES: **Arrest Statistics:** Population Reference Bureau, analysis of data from the Federal Bureau of Investigation, *Crime in the United States, Uniform Crime Reports*, 1984 through 1995. **Population**

Statistics: U.S. Bureau of the Census, Population Division.

Median Income of Families With Children in 1994 is the median annual income of families with "related children" under age 18 living in the household. "Related children" include the children of the householder (head of the household) by birth, marriage, or adoption, as well as other persons under age 18, such as nieces or nephews, who are related to the householder and living in the household. Figures are rounded to the nearest \$100. The median income is the dollar amount which divides the income distribution into two equal groups—half with income above the median, half with income below it. The figures shown here represent an average of data from 1992 through 1996. Although we refer to data collected in March 1994 as 1994 data, they actually reflect 1993 income. Figures are expressed in 1993 dollars.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1992 through 1996.

National Composite Rank for each state was obtained by converting the 1994 numerical values for each of the 10 indicators into standard scores, summing those standard scores to create a total standard score for each state, and ranking states on the basis of their total standard score in sequential order from highest/best (1) to lowest/worst (51). Standard scores are derived by subtracting the mean score from the observed score and dividing the amount by the standard deviation for that distribution of scores. All measures were given the same weight in calculating the overall standard score. In other words, no attempt was made to judge the relative importance of each indicator.

Definitions and Data Sources

Number of Children 1995-2005 is the total resident population under age 18 as of July 1 of their respective years, including dependents of Armed Forces personnel stationed in the area. The 1995 figure represents Census Bureau estimates as of July 1, 1995, while the 2005 total represents the Census Bureau's projections as of July 1, 2005. Population figures are rounded to the nearest hundred. The rounded numbers are used to calculate the "Percent Change 1995-2005" figures, which are themselves rounded to the nearest whole number.

SOURCES: Population Reference Bureau, analysis of state estimate and projection data from the U.S. Bureau of the Census (online). **1995 data:** Available at <http://www.census.gov/population/estimates/state/s95ag-s95ag795.txt> (July 12, 1996). **2005 data:** Available at <http://www.census.gov/population/projections/state/v01h005/> (various files, December 20, 1996).

Percent Change Over Time Analysis was computed by comparing the 1994 data for each of the 10 indicators with the data for the base year (1985). To calculate percent change, the value for 1985 is subtracted from the value for 1994, and that quantity is divided by the value for 1985. The results are multiplied by 100 for readability. The percent change was calculated on rounded data, and the "percent change" figure has been rounded to the nearest whole number.

Percent Low Birth Weight Babies is the percentage of live births weighing under 2,500 grams (5.5 pounds). The data are reported by place of mother's residence, not place of birth. Births of unknown weight are not included in these calculations.

SOURCES: National Center for Health Statistics. **1994 data:** Advance Report of Final Natality Statistics, 1994, *Monthly Vital Statistics Report*, Vol. 44, No. 11, Supplement (June 24, 1996), Tables 8 and 16. **1993 data:** Advance Report of Final Natality Statistics,

1993, *Monthly Vital Statistics Report*, Vol. 44, No. 3, Supplement (September 21, 1995), Tables 8 and 16.

Percent of 2-Year-Olds Who Were Immunized in 1995 is derived from the National Immunization Survey (NIS), which provides state estimates of vaccination coverage levels among children ages 19 to 35 months. The survey data were collected from July 1994 through June 1995. The figures given here reflect the percentage of children who have "4-3-1 Series Coverage", that is, four doses of Diphtheria and Tetanus Toxoids and Pertussis vaccine, three doses of Poliovirus vaccine, and one dose of Measles Mumps-Rubella vaccine. The figures were derived from a national sample of 35,440 children with a minimum of roughly 450 per state.

SOURCE: Centers for Disease Control and Prevention, "National, State, and Urban Area Vaccination Coverage Levels Among Children Aged 19-35 Months—United States, July 1994-June 1995," *Morbidity and Mortality Weekly Report*, Vol. 45, No. 24 (June 21, 1996), pp. 508-513.

Percent of 3- to 5-Year-Olds Who Were Not Enrolled in Nursery School or Kindergarten in 1993

is the percentage of 3- to 5-year-olds not enrolled in a nursery school or kindergarten program with a specific educational component. This data item reflects the extent to which children ages 3 to 5 are not gaining experience in a preschool learning environment.

This information is collected on the October supplement to the Current Population Survey conducted by the U.S. Bureau of the Census. To reduce random fluctuations due to small sample sizes, the figures provided here reflect five year averages of data from October 1991 through October 1995.

SOURCE: The Applied Population Laboratory at the University of Wisconsin-Madison, analysis of data from the U.S. Bureau of the Census, Current Population Survey (October supplement), 1991 through 1995.

Percent of 4th Grade Students Who Scored Below Basic Mathematics Level in 1996 is the share of 4th grade public school students failing to reach the basic proficiency level in mathematics, as measured by the National Assessment of Educational Progress (NAEP), conducted by the U.S. Department of Education.

The mathematics assessment measures five content areas—(1) numbers and operations, (2) measurement, (3) geometry, (4) data analysis, and (5) algebra and functions. The NAEP uses three proficiency categories—Advanced, Proficient, and Basic. Fourth grade students performing at the Basic level showed some basic understanding of mathematical concepts and procedures in the five NAEP content areas. Seven states (Idaho, Illinois, Kansas, New Hampshire, Ohio, Oklahoma, and South Dakota) did not participate in the 1996 NAEP Math Assessment for grade 4 students. In addition, the data for 11 other states (Alaska, Arkansas, Iowa, Michigan, Montana, Nevada, New

Jersey, New York, Pennsylvania, South Carolina, and Vermont) were published even though they did not meet all of the school participation rate guidelines for public schools.

SOURCE: National Center for Education Statistics, *NAEP 1996 Mathematics Report Card for the Nation and the States*, February 1997, Table 4.2.

Percent of 4th Grade Students Who Scored Below Basic Reading Level in 1994 is the share of 4th grade public school students failing to reach the basic proficiency level in reading, as measured by the National Assessment of Educational Progress (NAEP), conducted by the U.S. Department of Education.

The reading assessment measures three global purposes for reading—reading for literary experience, reading to gain information, and reading to perform a task. The NAEP uses three proficiency categories—Advanced, Proficient, and Basic. Fourth grade students at the Basic level could understand uncomplicated narratives and high-interest informative texts. They identified obvious themes, located explicit information, summarized parts of text, and made judgments about characters' actions. Nine states (Alaska, Illinois, Kansas, Nevada, Ohio, Oklahoma, Oregon, South Dakota, and Vermont) did not participate in the 1994 NAEP Reading Assessment. Two other states (Idaho and Michigan) did not meet minimum school participation guidelines, and the District of Columbia withdrew from the 1994 NAEP Assessment after data were collected. Therefore, scores were not reported for Idaho, Michigan, and the District of Columbia. In addition, the data for seven other states (Montana, Nebraska, New Hampshire, Pennsylvania, Rhode Island, South Carolina, and Tennessee) were published even though they did not meet all guidelines for samples established by NAEP.

SOURCE: National Center for Education Statistics, *NAEP 1994 Reading: A First Look*, Revised Edition, October 1995, Table 12.

Percent of Children in Poverty is the share of children under age 18 who live in families with incomes below the U.S. poverty threshold, as defined by the U.S. Office of Management and Budget. Only children who live in a household where they are related to the head of the household (referred to as the householder by the Census Bureau) are included in this analysis. These "related children" include the householder's children by birth, marriage, or adoption, as well as other persons under age 18, such as nieces or nephews, who are related to the householder.

In the Current Population Survey (CPS), families are surveyed each March and asked about their income in the previous calendar year. Poverty status is determined by comparing the income from the previous calendar year to the family composition as of the survey date in March. In calendar year 1993, the poverty threshold for a typical family of four persons was \$14,763. The data shown here represent five-year averages. For example, the figure for 1994 represents an average of CPS data collected from 1992 through 1996. We refer to the data collected in March 1994 as 1994 data even though they reflect 1993 income.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1993 through 1996.

Percent of Children in Extreme Poverty (Income Below 50% of Poverty Level) in 1994 is the share of children under age 18 who live in families with incomes below 50 percent of the U.S. poverty threshold, as defined by the U.S. Office of Management and Budget. In calendar year 1993, a

typical family of four fell in this category if their income fell below \$7,382. Only children who live in a household where they are related to the head of the household (referred to as the householder by the Census Bureau) are included in this analysis. These "related children" include the householder's children by birth, marriage, or adoption, as well as other persons under age 18, such as nieces or nephews, who are related to the householder. The figures shown here represent a five-year average of data collected from 1992 through 1996. We refer to the data collected in March 1994 as 1994 data even though they reflect 1993 income.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1992 through 1996.

Percent of Children Living in a Neighborhood Where More Than One-Quarter of 16- to 19-Year-Olds Were High School Dropouts in 1990

is the percentage of children living in a Census tract or Block Numbering Area where at least one-fourth of teens ages 16 to 19 were neither enrolled in school nor high school graduates. This measure reflects the share of children living in areas where dropping out of high school is not an unusual event.

SOURCE: The Kenan Institute of Private Enterprise at the University of North Carolina, analysis of U.S. Bureau of the Census, *Census of Population and Housing 1990*, Summary Tape File 3.

Percent of Children Living With Parents Who Were High School Dropouts in 1994 reflects the home educational environment of children in a state. This measure is based on the highest educational attainment of the parent(s) in the household where the child is living. For children in single-parent families, the measure reflects the educational attainment of that parent.

Definitions and Data Sources

For children in two-parent families, the attainment of the parent with the most education is used. These data come from the March supplement to the Current Population Survey. The figures provided here reflect a five-year average of data from 1992 through 1996.

SOURCE: The Urban Studies Institute at the University of Louisville, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1992 through 1996.

Percent of Children Without Health Insurance in 1994 is the percentage of children under age 18 who were not covered by any kind of public or private health insurance, including Medicaid, during the entire previous calendar year. The figures shown here represent a five-year average of data from 1992 through 1996.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1992 through 1996.

Percent of Families With Children Headed by a Single Parent is the percentage of all families with "own children" under age 18 living in the household, who are headed by a person—male or female—without a spouse present in the home. "Own children" are never married children under age 18 who are related to the householder by birth, marriage, or adoption.

The figures are derived from the monthly Current Population Survey conducted by the Census Bureau. Questions regarding family type are collected for all family households each month. A yearly average was calculated based on responses for the 12 months in the calendar year. The figures shown here represent three-year averages. For example, the figure for 1994 represents an average of data from 1993 through 1995.

Like all estimates derived from samples, these figures contain some amount of random error. The Bureau of Labor Statistics suggests that state rankings based on these figures should be used with caution. **SOURCE:** Special tabulations of 1984-1995 Current Population Survey microdata prepared by the Bureau of Labor Statistics.

Percent of Mother-Headed Families Receiving Child Support or Alimony in 1994 is the percentage of families headed by an unmarried woman (living with one or more of her own children under age 18) receiving either child support or alimony payments during the previous calendar year. "Own children" include children under age 18 who are sons or daughters by birth, stepchildren, or adopted children of the householder. Those categorized as receiving child support or alimony include those receiving partial payment as well as those receiving full payment. It should also be noted that there is no child support award in place for many of these families. Nationally, only 56 percent of all mother-headed families had a child support award in place in 1991.

The figures shown here represent an average of data from 1992 through 1996. We refer to data collected in March 1994 as 1994 data even though they reflect income received during 1993.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1992 through 1996.

Percent of Poor Families With Children Receiving Means-Tested Assistance in 1994 reflects the share of poor families with related children under age 18 who receive benefits from programs designed to assist low-income persons and families. The means-tested assistance programs included in this measure are Aid to Families With Dependent Children (AFDC), General Assistance,

Supplemental Security Income (SSI), Medicaid, Food Stamps, free or reduced-price school lunches, and housing or rent subsidies. These programs account for the vast majority of money spent on means-tested benefits. Since benefits often go to a household rather than to an individual child, we assume that children living in a household receiving means-tested assistance are helped by that assistance. Please note this measure reflects only poor families with children, but many means-tested programs also provide benefits to persons and families with incomes above the poverty level.

The figures shown here represent an average of data from 1992 through 1996. We refer to data collected in March 1994 as 1994 data even though they reflect benefits received during 1993.

SOURCE: Population Reference Bureau, analysis of data from the U.S. Bureau of the Census, Current Population Survey (March supplement), 1992 through 1996.

Percent of Teens Not Attending School and Not Working (ages 16-19) is the percentage of teenagers between ages 16 and 19 who are not enrolled in school (full- or part-time) and not employed (full- or part-time).

This measure is based on analysis of the 12-month Current Population Survey (CPS) file maintained by the Bureau of Labor Statistics. Each month the CPS asks respondents in about 60,000 households nationwide about their activities related to the labor force and education. Questions regarding school enrollment and employment are asked all 16- to 19-year olds in the sample each month. A yearly average was calculated based on responses for the 9 months children typically are in school (September through May). The figures shown here represent three-year averages. For example, data for 1994 represent an average of data from 1993 through 1995.

Like all estimates derived from samples, these figures contain some amount of random error. The Bureau of Labor Statistics suggests that state rankings based on these figures should be used with caution. **SOURCE:** Special tabulations of 1984-1995 Current Population Survey microdata prepared by the Bureau of Labor Statistics.

Percent of Teens Who Are High School Dropouts (ages 16-19) is the percentage of teenagers between ages 16 and 19 who are not enrolled in school and not high school graduates. Those who have a GED or equivalent are included as high school graduates in this measure. The measure used here is defined as a "status dropout" rate by the National Center for Education Statistics (NCES) as shown in their publication *Dropout Rates in the United States: 1994* (page 1). Currently, only 17 states and the District of Columbia have submitted dropout data to the NCES that meet quality and comparability levels needed to justify publishing estimates (see NCES, *Dropout Rates in the United States: 1994*, page 5). For the measures presented here, we focus on teens ages 16 to 19 rather than young adults ages 18 to 24 (which is the focus of *Dropout Rates in the United States: 1994*), because a large share of 18- to 24-year-olds migrate across state lines each year. The high interstate migration rates of 18- to 24-year-olds confounds the connection between state policies and programs and state dropout rates.

This measure is based on analysis of the 12-month Current Population Survey (CPS) file maintained by the Bureau of Labor Statistics. Each month the CPS asks respondents in about 60,000 households nationwide about their activities related to the labor force and education.

For this variable, a percentage was calculated for each year based on data for the 9 months children typically are in school (September through

May). The figures shown here represent three-year averages. For example, data for 1994 represent an average of data from 1993 through 1995.

Like all estimates derived from samples, these figures contain some amount of random error. The Bureau of Labor Statistics suggests that state rankings based on these figures should be used with caution. **SOURCE:** Special tabulations of 1984-1995 Current Population Survey microdata prepared by the Bureau of Labor Statistics.

Race/Ethnicity of Children 1995-2005 provides mutually exclusive categories for the five largest racial/ethnic groups. The Census Bureau, like most federal agencies, uses two distinct questions to collect data on race and Hispanic origin. One question is used to identify an individual's race; the other, to ascertain whether that person is of Hispanic origin. Consequently, persons of Hispanic origin may be of any race. (For example, a person of Puerto Rican ancestry may be both black and Hispanic.)

In order to provide mutually exclusive groupings, Hispanics were removed from each of the racial categories. In other words, the racial categories used here ("White," "Black," "Asian and Pacific Islander," and "Native American") do not include anyone who indicated that they were Hispanic. All persons who considered themselves to be Hispanic were included in the "Hispanic" category.

The 1995 figure represents Census Bureau projections as of July 1, 1995, while the 2005 total represents the Census Bureau's projections as of July 1, 2005. Population figures are rounded to the nearest hundred. The rounded numbers are used to calculate the "Percent Change 1995-2005" figures, which are themselves rounded to the nearest whole number. **SOURCES:** Population Reference Bureau, analysis of state projection data from U.S. Bureau of the Census (online). **1995 data:** Available at [<http://www.census.gov/population/projections/state/yr95to00/> \(various files, December 20, 1996\). **2005 data:** Available at <http://www.census.gov/population/projections/state/yr01to05/> \(various files, December 20, 1996\).](http://www.cen-</p>

Rate of Teen Deaths by Accident, Homicide, and Suicide (deaths per 100,000 teens ages 15-19) is the number of deaths from accident, homicide, and suicide per 100,000 teens between ages 15 and 19. (Previous editions of the *KIDS COUNT Data Book* referred to this measure as the Teen Violent Death Rate.) The data are reported by place of residence, not the place where the death occurred. **SOURCES: Death statistics:** Special tabulations by National Center for Health Statistics, Division of Vital Statistics, "Deaths From 282 Selected Causes, by 5-Year Age Groups, Race and Sex: U.S. and Each State," for each year from 1985 to 1994. **Population statistics:** Bureau of the Census, Population Division.

Teen Birth Rate (births per 1,000 females ages 15-17) is the number of births to teenagers between ages 15 and 17 per 1,000 females in this age group. Data reflect the mother's place of residence rather than place of birth. This measure of teenage childbearing focuses on the fertility of all females ages 15-17, regardless of marital status. We did not include births to females under age 15 in this analysis, since less than 5 percent of teen births occurred to females in that age group.

SOURCES: 1994 data: National Center for Health Statistics, "Recent Declines in Teenage Birth Rates in the United States: Variations by State, 1990-94," *Monthly Vital Statistics Report*, Vol. 45, No. 5, Supplement (December 19, 1996), Table 4. **1985 through 1993 data:** Child Trends, Inc., *Facts at a Glance* (Washington, DC, 1996).

Criteria for Selecting KIDS COUNT Indicators

Over the past several years, a set of criteria has been developed to select the statistical indicators used in the national *KIDS COUNT Data Book* to measure change over time and to rank the states. These criteria are described below.

1. Data must be from a reliable source. All of our data come from U.S. government agencies. Most of the data have been published or released to the public in some other form before we use it.

2. The statistical indicator must be available and consistent over time. Changes in methodologies, practices, or policies may affect year-to-year comparability.

3. The statistical indicator must be available and consistent across "all states." In practical terms this means data collected by the federal government or some other national organization.

4. The data item should reflect a salient outcome or measure of well-being. We focus on outcome measures rather than programmatic or service data (such as dollars spent on education or welfare costs), which are not always related to the actual well-being of children.

5. The data item must be easily understandable to the public. We are trying to reach an educated lay public, not academic scholars or researchers. Measures that are too complex will not be effective.

6. The data item must have a relatively unambiguous interpretation. If the value of an indicator changes, we want to be sure there is widespread agreement that this is a good thing (or a bad thing) for kids.

7. There should be a high probability that the measure will continue to be produced in the near future. We want to establish a series of indicators that can be produced year after year.

For additional information on characteristics of good indicators of child well-being see:

America's Children: Key National Indicators of Well-Being. Forthcoming from the Federal Interagency Forum on Child and Family Statistics, Washington, DC.

Trends in the Well-Being of America's Children and Youth: 1996. U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation, Washington, DC.

"Indicators of Children's Well-Being: A Conference," in *FOCUS*, Vol. 16, No. 3, Spring 1995, Institute for Research on Poverty, University of Wisconsin-Madison.

Douglas W. Nelson
President

At the Annie E. Casey Foundation, we are committed to

the well-being of every child and family in America.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.

We believe that every child deserves the opportunity to

live in a safe, stable, and loving home.
